## Variables

### ***Execute a piece of code***

Rather than drag and drop actions, you can use the more powerful code. The “execute a piece of code” action looks like this:

You can type code into this window or paste to it from help or elsewhere. Note how the colour changes when Gamemaker recognises something, for example:

```
if(mouse_x<200 && mouse_y<200) window_set_cursor(cr_hourglass) else  
window_set_cursor (cr_default)
```

light blue for variables  
dark blue for functions  
red for constants  
magenta for objects  
green for comments  
bold for language words

If you don't get the colour you expect, you have made a typing error

Try this,  
new game  
add an object  
add event step  
execute a piece of code

```
if(mouse_x<200 && mouse_y<200) window_set_cursor(cr_hourglass) else  
window_set_cursor (cr_default)
```

new room  
place object in room  
run

### ***Setting and testing variables***

You can use code fragments in “set the value of a variable”

and test with “if a variable has a value” or “if an expression is true”

## ***Common variables***

**x** Is an object’s x-position.

**y** Is an object’s y-position.

### **Example:**

new game

new sprite

new object

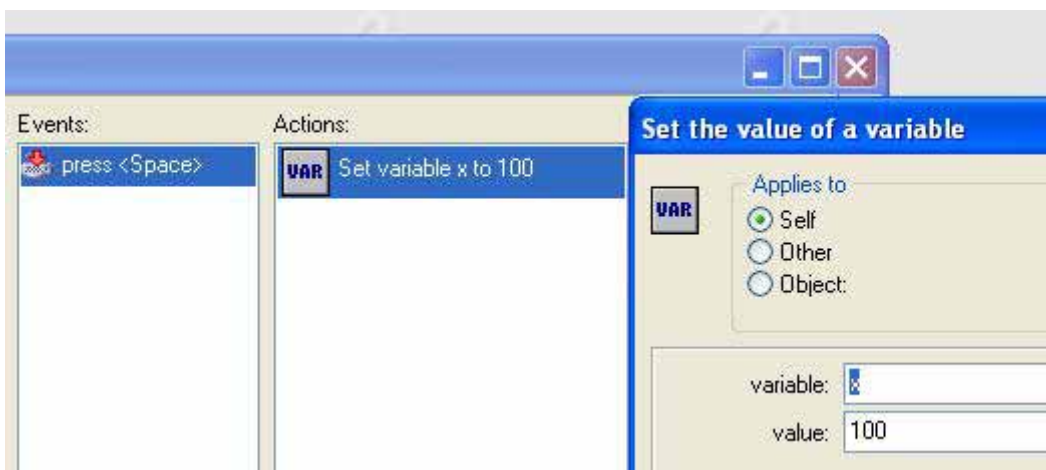

set the sprite for the object

add event keypress<space>

set the value of a variable

x=100

y=100

new room

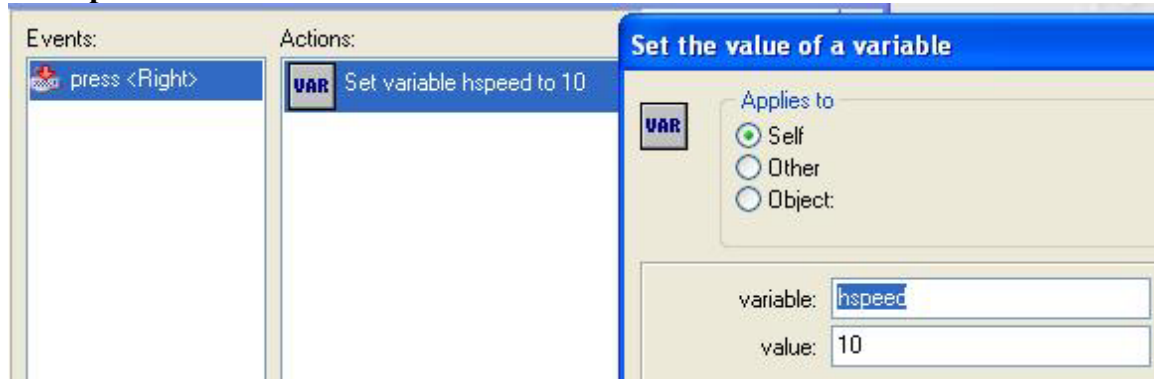

place object in room

run

it jumps to position 100 100 when you press space

**hspeed** Horizontal component of the speed.

## Example

In the keypress<right> event  
`hspeed = 10`     *move to the right speed 10 when you press right cursor*

**vspeed** Vertical component of the speed.

**direction** Its current direction (0-360, counter-clockwise, 0 = to the right).

**speed** Its current speed (pixels per step).

**mouse\_x** X-coordinate of the mouse.

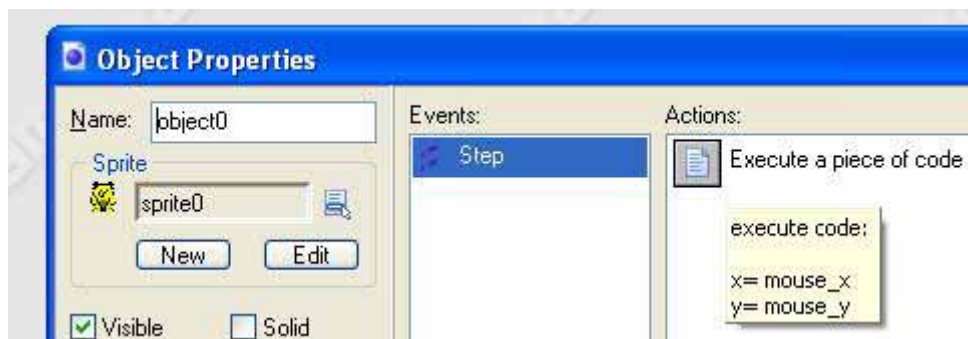

**mouse\_y** Y-coordinate of the mouse.

## Example:

In the step event

`x = mouse_x`

`y = mouse_y`     *the object moves with the mouse*

## Scope and visibility

There are some reserved names

`mouse_x`

`mouse_y`

`health`

`score`

lives  
room\_width  
room\_height  
which are global

most variables belong to the object within which they are defined

there is also the global object `global` eg `global.x`

So for code within `object0`, `x` is the horizontal position  
to refer to it from inside another object use `object0.x` (*is the x value or horizontal position of object0*)

See <http://www.schoolgamemaker.rupert.id.au/samples1/inventory.gm6>

The object "inventory" is used to keep track of diamonds, the variable "diamonds" is the number of diamonds collected

**Create Event:**  
set variable diamonds to 0

When you collide with the diamond it is destroyed and the inventory count increases by 1

**Collision Event with object object1:**  
set variable inventory.diamonds relative to 1  
for other object: destroy the instance

diamonds lives inside the inventory object, when referred to inside inventory, you can just call it diamonds, when referred from another object, you must use the full name `inventory.diamonds`

In the draw event for inventory, a box and the collected diamonds are drawn

**Draw Event:**  
set the fill color to 16777215 and line color to 0  
draw rectangle with vertices (0,0) and (200,40)

A white box is drawn

set variable i to 0  
repeat next action (block) diamonds times  
    at position (20\*i,0) draw image -1 of sprite sprite1  
    set variable i relative to 1

The sprite is drawn "diamonds" times  
i is increased each time it is drawn, it is drawn further to the right each time as i increases

## **Persistence**

Objects and rooms can be persistent

Normally objects and rooms are created fresh every time

See <http://www.schoolgamemaker.rupert.id.au/samples2/persistent.gmd>

The balls in room 0 stay where left  
in room 1 they revert to original positions

See <http://www.schoolgamemaker.rupert.id.au/samples2/persistentobject.gmd>

Move the dog with the mouse

When the dog walks through paint, it is that colour in all rooms

Turn off persistent for the dog and it starts anew in each room

# Sprites and Drawing

## *Steering a car*

We will rotate a car using its inbuilt variable “direction”

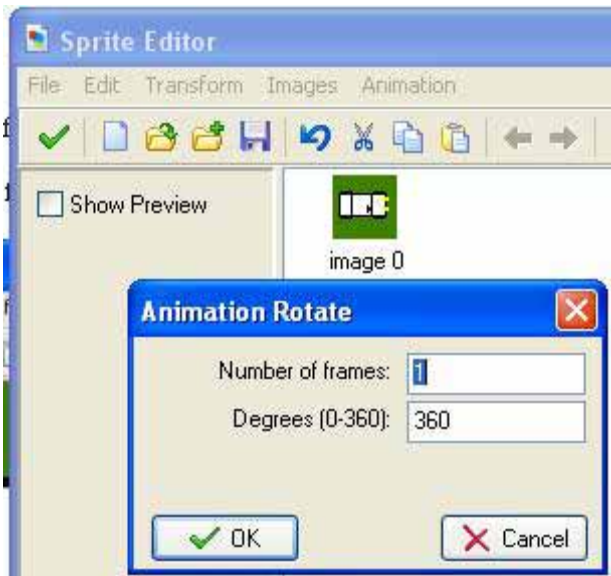

Add a sprite  
edit sprite  
double click image0  
zoom in with magnifying glass

Draw a car facing left

Note the colour of the bottom left pixel becomes transparent

To draw this at 10 degree rotation,  
close with the green tick  
animation|rotation sequence|counterclockwise

now add an object and room  
 put the object in the room  
 in the object's step event  
 move in the direction of a point mouse\_x, mouse\_y at speed 1  
 change the sprite, sprite0, subimage direction/10

---

Now we will display some text  
 Delete the change sprite in the step event  
 Instead use draw sprite in the draw event

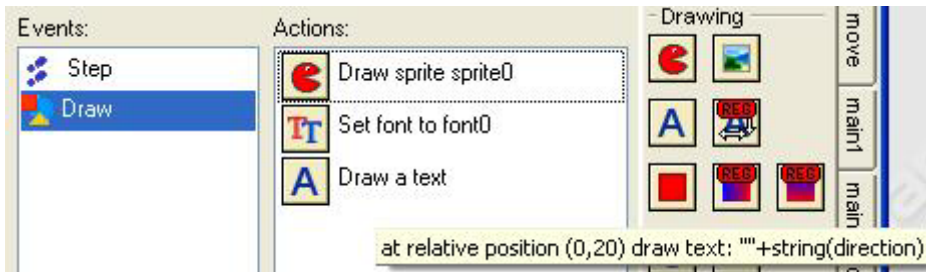

It should work the same

Add a font, (Arial 12 is OK)

In the draw event,

set the font to font0

Draw a text: ""+string(direction), 0,20 relative

## The clock

Add object

Add room

Room properties, settings 400x400

Place object in room

Draw event, execute a piece of code

`draw_circle(200,200,130,true)` see help game graphics, drawing shapes

Run it, that's the circle

```
minuteangle=2*pi*current_second/60
```

```
x2=200+100*sin(minuteangle)
```

```
y2=200-100*cos(minuteangle)
```

x2,y2 is the tip of the second hand and 200,200 the centre

```
draw_line(200,200,x2,y2)
```

Now repeat for minute and hour, a little shorter

you will need `current_minute` and `current_hour` which are in help under gameplay, timing

Add the hour marks

```
for(i=0; i<12; i+=1)
```

```
{
```

```
    x1=200+110*sin(2*pi*(i)/12)
```

```
    y1=200-110*cos(2*pi*(i)/12)
```

```
    x2=200+125*sin(2*pi*(i)/12)
```

```
    y2=200-125*cos(2*pi*(i)/12)
```

```
    draw_line(x1,y1,x2,y2)
```

```
}
```

Completed clock at <http://www.schoolgamemaker.rupert.id.au/samples4/clock6.gm6>

Add the day and date, maybe even an alarm

## **Individual health bars**

There is a global variable, "health" and you can draw the health for one object

New sprite

new object

new room

place object in room

draw event, draw a sprite, sprite0 0,0 relative

from the score tab, draw the health bar, -20,30,20,40 relative

But health is global and you can't have instances with different health, test this with multiple instances and eg mouse click reducing health

Delete: draw a health bar

create event, set the value of a variable, energy ,30

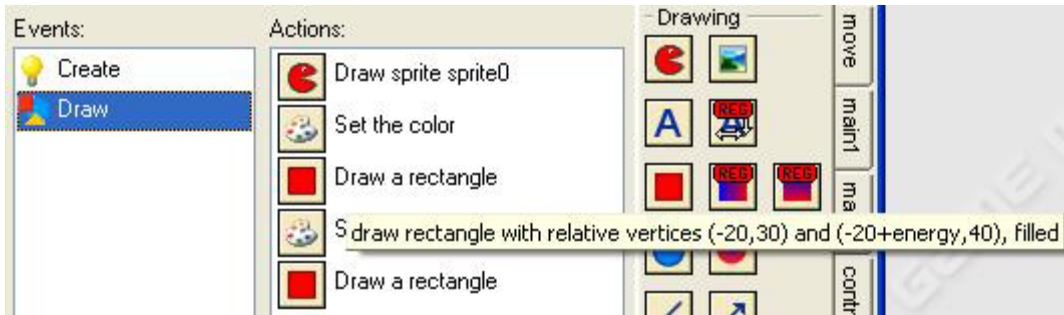

draw event

set the colour to green

draw rectangle  $-20,30,-20+energy,40$ , filled, relative (this is the energy)

set the colour to black

draw rectangle  $-20,30,20,40$ , outline, relative (this is the outline)

test this with multiple instances with differing energy

See <http://www.schoolgamemaker.rupert.id.au/samples1/healthbar.gm6>

Tony Forster <http://www.schoolgamemaker.rupert.id.au/> July 07

## Entering Data

See <http://www.schoolgamemaker.rupert.id.au/samples1/questions.gmd>

One drag and drop item

The rest are code

```
result = show_menu('menu0|menu1|menu2',0)
show_message('menu '+string(result)+' selected')
if(show_question('yes or no')=1)
    show_message('you said yes')
else
    show_message('you said no')
show_message('squared is' + string(sqrt(get_integer('enter a
number',0))))
show_message('you entered:' +get_string('enter text','no string'))
show_message('colour number '+string(get_color(0)))
```

## Miscellaneous

### *Random*

**random(x)**

**random(x)** Returns a random real number between 0 and x. The number is always smaller than x.

## ***With***

In addition to the usual

**if** (<expression>) <statement>

**repeat** (<expression>) <statement>

**while** (<expression>) <statement>

**do** <statement> **until**(<expression>)

**for** (<statement1> ; <expression> ;<statement2>) <statement3>

there is the **with** construction

**with** (object) <statement> repeats statement for all instances of object

## ***Self, other, all, instance***

**self** // *the object containing the code*

**other** // *the other object in the collision*

**all** // *all instances of all objects in the room*

**object0** // *all instances of object0 in the room*

## ***What do these do? Try them***

(You can paste these from this document directly into the “execute a piece of code” window)

In the step event:

```
if(mouse_x<200 && mouse_y<200) window_set_cursor(cr_hourglass) else  
window_set_cursor (cr_default)
```

in a keypress event

```
for (i=0 ; i<10 ; i=i+1) instance_create(x+10*i,y+10*i,object0)
```

What’s the difference between

**with** (object0) instance\_destroy() and instance\_destroy()

when placed in object0’s code? in another object’s code

In a keypress event:

```
instance_create(random(400),random(400),object0)
```

In the step event:

```
if (x<0) hspeed=5
```

```
if (x>300) hspeed=-5
```

try this in the draw event:

```
draw_sprite(sprite0,-1,x-5,y)
draw_sprite(sprite1,-1,x+5,y)
```

### **instance\_create**

instance\_create (x,y,obj) Creates an instance of obj at position (x,y).

Example:

In a keypress<space> event

`instance_create (100,100,object0)` create an object0 at position 100 100 of the screen

### **instance\_change**

instance\_change (obj,perf) Changes the instance into obj. perf indicates whether to perform the destroy and creation events.

Example:

`instance_change (object0,false)` change into object0 without performing the destroy and creation events

## **More reading**

Go to gamemaker help contents and look at The Gamemaker Language, there are heaps of useful things there.

## **Gamemaker Code – self paced tutorial**

### **Getting started**

Just like any other Gamemaker game, you will need a sprite

I'll choose the teddy

You will need an object

You need to assign the sprite to the object

You need a room

You need to put the teddy in the room

### **Making Teddy Move**

OK so far its all been the same as what we've done with drag and drop. Now we'll make teddy move with the arrow keys but we'll use code.

Add event keyboard left

Drag an "Execute a piece of code" action into the action window

See how a window opens up

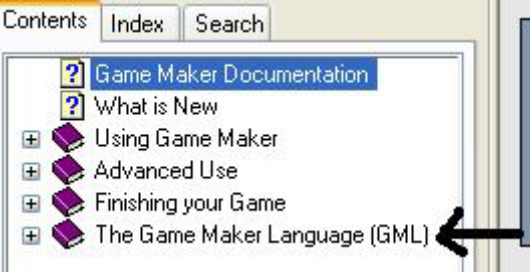

When we hit keyboard left we want teddy to move left, we want to set the horizontal speed to a negative value because in Gamemaker, positive is too the right. There's an inbuilt variable for every object, the horizontal component of speed `hspeed`.

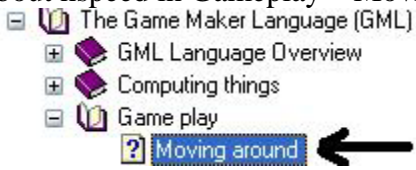

How did I know that? Its in the help.

All the code stuff is at the end under Game Maker Language (GML)

I found about `hspeed` in Gameplay – Moving around

`hspeed` Horizontal component of the speed

Lets make `hspeed` -5

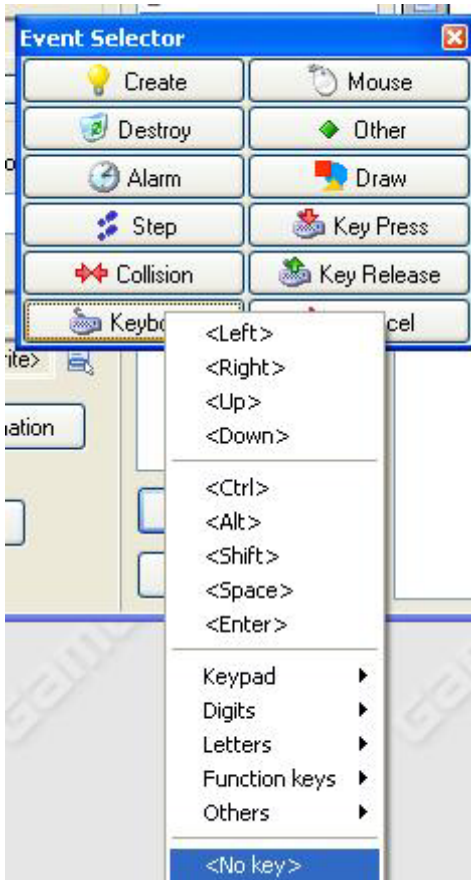

Note how `hspeed` is in blue, Gamemaker recognised it as a variable

Just like `hspeed` is the horizontal component of speed, `vspeed` is the vertical component.

Now add event keyboard right, make `hspeed` =5  
add event keyboard up make `vspeed` =-5  
add event keyboard down make `vspeed` =5

See how we can move teddy with the cursor keys. Now I want teddy to stop when I'm not pressing a key.

Add event keyboard no key

And drag in the “execute a piece of code” action

Now I could type

```
vspeed=0
```

```
hspeed=0
```

but I read the help and noticed another variable `speed` so I'll just type

```
speed=0
```

Ok it works. What next?

### ***Something to shoot at***

Shooting is not 'politically correct'. Big problem. Ghosts don't have rights. Lets shoot ghosts.

Like before get a new sprite

Get a new object, assign the sprite to the object and put the object in the room

Ok, we want the ghost to move in a random direction  
Add a create event for the ghost

Drag an “Execute a piece of code” action into the action window

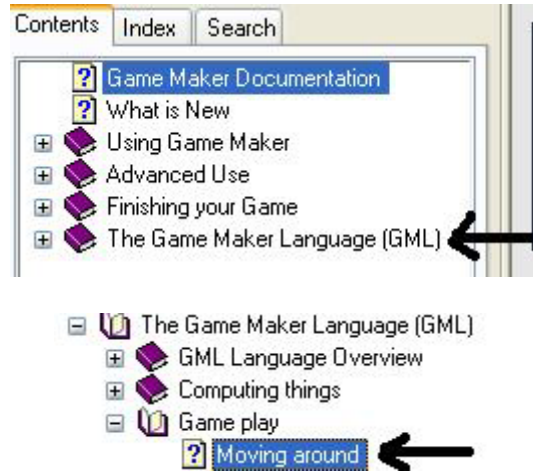

We'll give the ghost a fixed `speed` but a random `direction`

`speed=5`

`direction=random(360)`

How did I know about the variables `speed` and `direction`?  
Found them same place as `vspeed` and `hspeed`

How did I know about the function `random`

`random(x)` Returns a random real number between 0 and x. The number is always smaller than x

Lets keep the ghost in the room by making it wrap  
Add event other / outside room

Add this code to make it wrap

```
move_wrap(true,true,0)
```

Where did `move_wrap(true,true,0)` come from?

**move\_wrap(hor,vert,margin)** Wraps the instance when it has left the room to the other side. hor indicates whether to wrap horizontally and vert indicates whether to wrap vertically. margin indicates how far the origin of the instance must be outside the room before the wrap happens. So it is a margin around the room. You typically use this function in the Outside event.

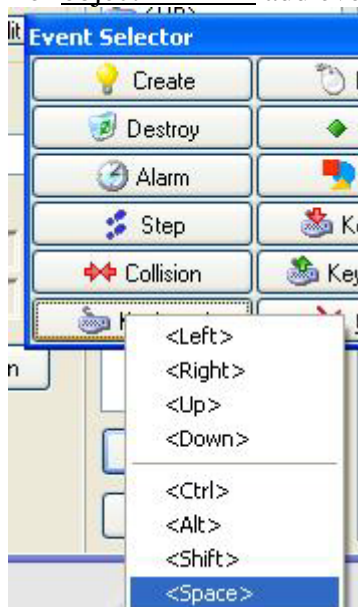

Note how `true` is red, it is a pre-defined constant

## OK Lets Shoot!!

We need a sprite for our bullet, an object for our bullet and we need to assign the sprite to the object. Do it. The bullet should be `object2`

Now, we'll shoot bullets from the teddy when we press space

For object TEDDY add event keyboard space

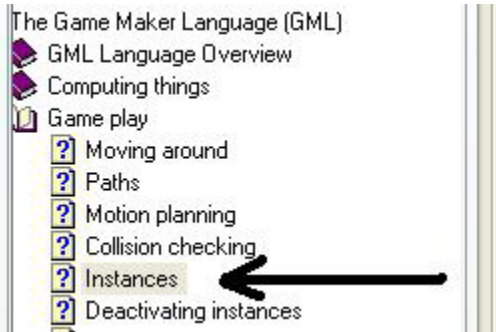

And add the following code

```
instance_create(x,y,object2)
```

(I'm assuming that `object2` is your bullet too)

Because we are inside the teddy object, `x` and `y` refer to the position of the teddy so the bullet appears where the teddy is, position `x,y`

Where did `instance_create(x,y,object2)` come from?

The screenshot shows a list of GML topics. The 'Instances' topic is highlighted in yellow, and a black arrow points to it from the right. The list includes: The Game Maker Language (GML), GML Language Overview, Computing things, Game play, Moving around, Paths, Motion planning, Collision checking, Instances, and Deactivating instances.

`instance_create(x,y,obj)` Creates an instance of `obj` at position `(x,y)`. The function returns the id of the new instance

Small problem, the bullet doesn't move

For the bullet, add event create

```
speed=10
```

```
direction=object0.direction
```

The bullets are created with `speed=10` and their direction is set to the same `direction` as the teddy

What's the dot all about?

In `direction=object0.direction` the dot "." is important

If we are inside an object, `x`, `y`, `vspeed`, `hspeed` etc refer to that object, if we want to refer to other objects we use the dot

## ***Kill Ghosts***

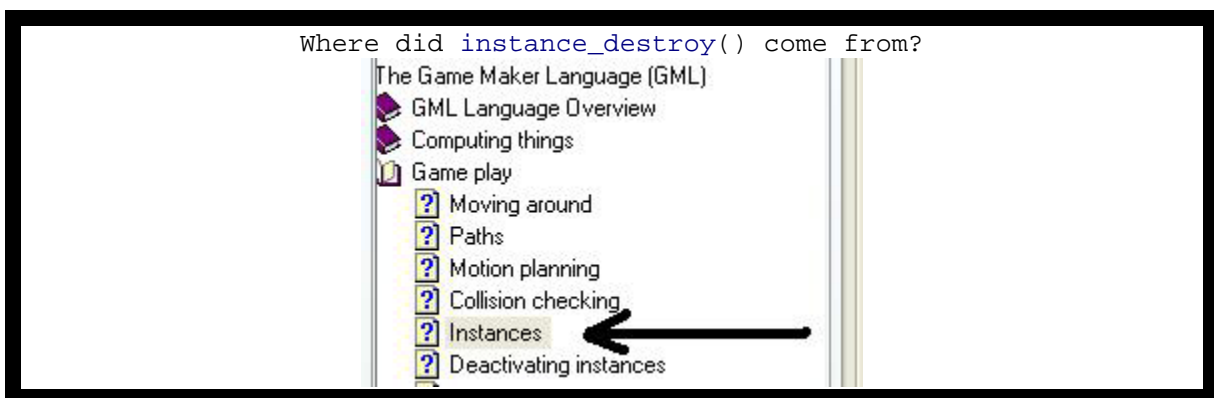

Ok when the bullet collides with the ghost we destroy the ghost. Easy.

For object ghost add the collision event with the bullet

And add the following code

```
instance_destroy()
```

In case its not working for you, here's the pseudo code for my program. You can display pseudo code with alt / edit / show object information  
My teddy is object0, ghost object1 and bullet object2

**Information about object: object0**

Sprite: sprite0  
Solid: false  
Visible: true  
Depth: 0  
Persistent: false  
Parent: <no parent>  
Mask: <same as sprite>

**Keyboard Event for <no key> Key:**  
execute code:

speed=0

**Keyboard Event for <Space> Key:**  
execute code:

instance\_create(x,y,object2)

**Keyboard Event for <Left> Key:**  
execute code:

hspeed=-5

**Keyboard Event for <Up> Key:**  
execute code:

vspeed=-5

**Keyboard Event for <Right> Key:**  
execute code:

hspeed=5

**Keyboard Event for <Down> Key:**  
execute code:

vspeed=5

---

## Information about object: object1

Sprite: sprite1  
Solid: false  
Visible: true  
Depth: 0  
Persistent: false  
Parent: <no parent>  
Mask: <same as sprite>

**Create Event:**  
execute code:

speed=5  
direction=random(360)

**Collision Event with object object2:**  
execute code:

instance\_destroy()

**Other Event: Outside Room:**  
execute code:

move\_wrap(true,true,0)

---

## Information about object: object2

Sprite: sprite2  
Solid: false  
Visible: true  
Depth: 0  
Persistent: false  
Parent: <no parent>  
Mask: <same as sprite>

### Create Event:

execute code:

```
speed=10  
direction=object0.direction
```

---

Total for the above,

10 marks

---

Add a sound when you shoot

1 mark

Hint:

You'll find `sound_play(sound0)` at

When you shoot all ghosts, go to the next room

1 mark

Hint:

Use `if` , `instance_number()` and `room_goto_next()`

---

Make homing missiles

1 mark

Hint:

`move_towards_point()`

---

Show the score

1 mark

---

Show a dialogue box congratulating you when you have won the game

1 mark

---

---

Show the help screen when you first start the game 1 mark

---

When you shoot the ghost boss, have 10 ghosts spawn at random places which you then have to shoot 1 mark

Hint:

Use `repeat ()` `random()` and `instance_create()`

---

In the above, instead of using `repeat ()` use `for ()` 1 mark

---

In the above, instead of using `repeat ()` use `do` 1 mark

---

In the above, instead of using `repeat ()` use `while ()` 1 mark

---
